Sit and Be Fit Home Exercise Program

Exercise 1: Bicep curls
Reps: 10, Sets 2-3 as tolerated
Biceps brachii: When contracted, this muscle pulls up the forearm with the arm bending at the elbow:
Brachialis + Brachioradialis: These muscles sit underneath the biceps brachii and help to flex the elbow
Wrist flexors and extensors: Together these muscle groups contract isometrically to hold your wrist stable as you curl your dumbbell or any other weight
Why are they important? You use these muscles any time you pick something up, which is common in most ADLS

Exercise 2: Torso twists
Reps: 10, Sets 2-3 as tolerated
Obliques: Both internal and external obliques are responsible for performing spinal rotation. The obliques help to increase your intra-abdominal pressure which stabilizes and protects your spine as you twist
Assisting muscles: Psoas major, quadratus lumborum, iliacostalis. These muscles stabilize pelvis and contribute with spinal rotation.
Why are they important? The muscles involved in torso twists are ones that maintain proper posture and stability in most tasks we partake in

Exercise 3: Calf raises
Reps: 10, Sets 2-3 as tolerated
Gastrocnemius: Along with the soleus, the function of this muscle is plantar flexion of the foot at the ankle joint and flexing the leg at the knee joint.
Peroneous Muscles: These muscles help to assist in plantar flexion
Why are they important? These muscles propel you forward with every single step, they absorb load with each impact, and they support the rest of your lower limb and body. By increasing the strength in these muscles, you will become faster and more agile while moving

Exercise 4: Shoulder shrugs
Reps: 10, Sets 2-3 as tolerated
Trapezius: The trapezius supports the rotation of your scapula, which enables you to raise your arms above shoulder level.
Erector spinae: These are long muscles that run from your tailbone right up to your lower neck. These muscles stabilize your position and are important in preventing back injury
Why are they important? These muscles are important in elevating and upwardly rotating the scapula and extending the neck. Keeping these muscles healthy can improve ADLs that involve throwing or lifting objects.
