CLIENT & FAMILY EDUCATION ON LOW VISION

BY: MELONY ARABBO
WHAT IS LOW VISION?

• Low-Vision occurs when there is damage to structures of the eye or the pathway from the retina to the visual cortex

• Low-Vision can be a result of a chronic condition such as diabetic retinopathy or macular degeneration

• Acute conditions might be due to a sudden stroke
WHY IS LOW-VISION A PROBLEM?

• Low-Vision can jeopardize the safety of ones’ well being; they could be more susceptible to falls and be of danger to others and themselves when driving.

• One of the main components of activities of daily living (ADLs) is vision. If our vision is being compromised or is low, we are not able to be completely independent.
Clients with low-vision may have questions and concerns about their eye condition, whether they can drive, read, care for children, travel or work.

As occupational therapists, we should be prepared to answer any questions related to low-vision that our patient may have about the process or the severity of their prognosis.
CONDITIONS THAT CAN CAUSE LOW-VISION IMPAIRMENTS

• THE FOUR MOST COMMON CONDITIONS THAT CAUSE LOW-VISION ARE:
1. MACULAR DEGENERATION
2. DIABETIC RETINOPATHY
3. GLAUCOMA
4. CATARACTS
TREATMENT APPROACHES

• Educate the client and family on the nature of their eye disease and expectations of vision rehabilitation.

• Therapeutic activities: scanning, eccentric viewing, and reading skills

• Environmental Modifications: lighting contrast and glare

• Non-optical assistive devices: visual, tactile, and auditory

• Optical magnification

• Resources and handouts
TIPS FOR MAKING PRINT READABLE

• Use larger print
• Avoid decorative fonts as well as use bold type because the thickness helps make the letters legible
• Make sure the color is legible: dark blue and green are most preferred
• Avoid glossy pages because it causes a glare

• **Contrast is important:** make sure that if the background is light, then the lettering should be dark & vice versa
• **Tracking between the letters:** allow a good amount of space between the letters
• **Margins:** an extra-wide binding margin makes it easier for the patient to use a magnifier on the paper
The interventions I listed can improve occupational engagement by allowing the patient to be able to read and write with their low vision.

As shown in the video, she lost vision in her central field but was able to continue reading and writing with a magnifier.

I provided multiple tips and strategies to allow a patient with low-vision to be able to participate in various activities.
• Patients who are experiencing low-vision can see an ophthalmologist or optometrist.

• An ophthalmologist is a medical or osteopathic doctor who specializes in eye or vision care and perform eye surgery. They are also able to prescribe eyeglasses and contact lenses to correct vision problems.

• An optometrist can test and correct the diagnosis of the patient, the treatment, and management of vision changes. They are not a medical doctor. They usually perform eye exams and vision tests.
